

## DIVISION

### (WORD PROBLEMS)

The word problems for division are easy to solve. You just have to gather the data/information provided in the problem, analyze what operation should be applied and solve it accordingly.

#### Example:

A teacher has 35 books. She has to distribute these books among 7 children. How many books will each child get?

#### Solution:

Total number of books = 35 (dividend)

Number of children = 7 (divisor)

Number of books each child gets = ? (quotient)

We will divide 35 by 7 to know how many books each child will get.

Number of books each child gets = **7**

$$\begin{array}{r} 5 \\ 7 \overline{) 35} \\ \underline{35} \\ 0 \end{array}$$
