# DATA REPRESENTATION

'Bar Graphs'

Bar Graphs are used to represent data in form of rectangular bars.

It has a **title** which tells us what the graph is about. The **axes** are also labeled. One of them shows the categories (of the data collected) and the other shows the numerical values.

Lets looks at the example below.

The bar graph above shows the age of 5 children.

It tells us that, Ahmad is 12 years old, Jameel is 15 years old, Faheem is 8 years old and so on.

According to the data we can know that Faheem is the youngest of all and Jameel is the oldest.
